Neural ODE

Adjoint functions

$$\mathbf{a}_z(t) = \frac{\partial L(\mathbf{y})}{\partial \mathbf{z}(t)}; \quad \mathbf{a}_\theta(t) = \frac{\partial L(\mathbf{y})}{\partial \theta(t)}.$$

Theorem (Pontryagin)

$$\frac{d\mathbf{a}_z(t)}{dt} = -\mathbf{a}_z(t)^T \cdot \frac{\partial f(\mathbf{z}(t), \theta)}{\partial \mathbf{z}}; \quad \frac{d\mathbf{a}_\theta(t)}{dt} = -\mathbf{a}_z(t)^T \cdot \frac{\partial f(\mathbf{z}(t), \theta)}{\partial \theta}.$$

Do we know any initial condition?

Solution for adjoint function

$$\frac{\partial L}{\partial \theta(t_0)} = \mathbf{a}_\theta(t_0) = - \int_{t_1}^{t_0} \mathbf{a}_z(t)^T \frac{\partial f(\mathbf{z}(t), \theta)}{\partial \theta(t)} dt + 0$$

$$\frac{\partial L}{\partial \mathbf{z}(t_0)} = \mathbf{a}_z(t_0) = - \int_{t_1}^{t_0} \mathbf{a}_z(t)^T \frac{\partial f(\mathbf{z}(t), \theta)}{\partial \mathbf{z}(t)} dt + \frac{\partial L}{\partial \mathbf{z}(t_1)}$$

Note: These equations are solved back in time.

Neural ODE

Forward pass

$$\mathbf{z}(t_1) = \int_{t_0}^{t_1} f(\mathbf{z}(t), \boldsymbol{\theta}) dt + \mathbf{z}_0 \Rightarrow \text{ODE Solver}$$

Backward pass

$$\left. \begin{aligned} \frac{\partial L}{\partial \boldsymbol{\theta}(t_0)} &= \mathbf{a}_{\boldsymbol{\theta}}(t_0) = - \int_{t_1}^{t_0} \mathbf{a}_{\mathbf{z}}(t)^T \frac{\partial f(\mathbf{z}(t), \boldsymbol{\theta})}{\partial \boldsymbol{\theta}(t)} dt + 0 \\ \frac{\partial L}{\partial \mathbf{z}(t_0)} &= \mathbf{a}_{\mathbf{z}}(t_0) = - \int_{t_1}^{t_0} \mathbf{a}_{\mathbf{z}}(t)^T \frac{\partial f(\mathbf{z}(t), \boldsymbol{\theta})}{\partial \mathbf{z}(t)} dt + \frac{\partial L}{\partial \mathbf{z}(t_1)} \\ \mathbf{z}(t_0) &= - \int_{t_1}^{t_0} f(\mathbf{z}(t), \boldsymbol{\theta}) dt + \mathbf{z}_1. \end{aligned} \right\} \Rightarrow \text{ODE Solver}$$

Note: These scary formulas are the standard backprop in the discrete case.

Continuous Normalizing Flows

Discrete Normalizing Flows

$$\mathbf{z}_{t+1} = f(\mathbf{z}_t, \boldsymbol{\theta}); \quad \log p(\mathbf{z}_{t+1}) = \log p(\mathbf{z}_t) - \log \left| \det \frac{\partial f(\mathbf{z}_t, \boldsymbol{\theta})}{\partial \mathbf{z}_t} \right|.$$

Continuous-in-time dynamic transformation

$$\frac{d\mathbf{z}(t)}{dt} = f(\mathbf{z}(t), \boldsymbol{\theta}).$$

Assume that function f is uniformly Lipschitz continuous in \mathbf{z} and continuous in t . From Picard's existence theorem, it follows that the above ODE has a **unique solution**.

Forward and inverse transforms

$$\begin{aligned}\mathbf{x} = \mathbf{z}(t_1) &= \mathbf{z}(t_0) + \int_{t_0}^{t_1} f(\mathbf{z}(t), \boldsymbol{\theta}) dt \\ \mathbf{z} = \mathbf{z}(t_0) &= \mathbf{z}(t_1) + \int_{t_1}^{t_0} f(\mathbf{z}(t), \boldsymbol{\theta}) dt\end{aligned}$$

Continuous Normalizing Flows

To train this flow we have to get the way to calculate the density $p(\mathbf{z}(t))$.

Theorem (special case of Kolmogorov-Fokker-Planck)

if function f is uniformly Lipschitz continuous in \mathbf{z} and continuous in t , then

$$\frac{d \log p(\mathbf{z}(t))}{dt} = -\text{tr} \left(\frac{\partial f(\mathbf{z}(t), \boldsymbol{\theta})}{\partial \mathbf{z}(t)} \right).$$

Note: Unlike discrete-in-time flows, the function f does not need to be bijective, because uniqueness guarantees that the entire transformation is automatically bijective.

Density evaluation

$$\log p(\mathbf{x}|\boldsymbol{\theta}) = \log p(\mathbf{z}) - \int_{t_0}^{t_1} \text{tr} \left(\frac{\partial f(\mathbf{z}(t), \boldsymbol{\theta})}{\partial \mathbf{z}(t)} \right) dt.$$

Adjoint method is used to integral evaluation.

Continuous Normalizing Flows

Forward transform + log-density

$$\begin{bmatrix} \mathbf{x} \\ \log p(\mathbf{x}|\boldsymbol{\theta}) \end{bmatrix} = \begin{bmatrix} \mathbf{z} \\ \log p(\mathbf{z}) \end{bmatrix} + \int_{t_0}^{t_1} \begin{bmatrix} f(\mathbf{z}(t), \boldsymbol{\theta}) \\ -\text{tr} \left(\frac{\partial f(\mathbf{z}(t), \boldsymbol{\theta})}{\partial \mathbf{z}(t)} \right) \end{bmatrix} dt.$$

- ▶ Discrete-in-time normalizing flows need invertible f . It costs $O(d^3)$ to get determinant of the Jacobian.
- ▶ Continuous-in-time flows require only smoothness of f . It costs $O(d^2)$ to get the trace of the Jacobian.

Generative models zoo

Langevin dynamic

Imagine that we have some generative model $p(\mathbf{x}|\boldsymbol{\theta})$.

Statement

Let \mathbf{x}_0 be a random vector. Then under mild regularity conditions for small enough η samples from the following dynamics

$$\mathbf{x}_{t+1} = \mathbf{x}_t + \eta \frac{1}{2} \nabla_{\mathbf{x}_t} \log p(\mathbf{x}_t | \boldsymbol{\theta}) + \sqrt{\eta} \cdot \boldsymbol{\epsilon}, \quad \boldsymbol{\epsilon} \sim \mathcal{N}(0, 1).$$

will come from $p(\mathbf{x}|\boldsymbol{\theta})$.

What do we get if $\boldsymbol{\epsilon} = \mathbf{0}$?

Energy-based model

$$p(\mathbf{x}|\boldsymbol{\theta}) = \frac{\hat{p}(\mathbf{x}|\boldsymbol{\theta})}{Z_{\boldsymbol{\theta}}}, \quad \text{where } Z_{\boldsymbol{\theta}} = \int \hat{p}(\mathbf{x}|\boldsymbol{\theta}) d\mathbf{x}$$

$$\nabla_{\mathbf{x}} \log p(\mathbf{x}|\boldsymbol{\theta}) = \nabla_{\mathbf{x}} \log \hat{p}(\mathbf{x}|\boldsymbol{\theta}) - \nabla_{\mathbf{x}} \log Z_{\boldsymbol{\theta}} = \nabla_{\mathbf{x}} \log \hat{p}(\mathbf{x}|\boldsymbol{\theta})$$

Stochastic differential equation (SDE)

Let define stochastic process $\mathbf{x}(t)$ with initial condition $\mathbf{x}(0) \sim p_0(\mathbf{x})$:

$$d\mathbf{x} = \mathbf{f}(\mathbf{x}, t)dt + g(t)d\mathbf{w}$$

- ▶ $\mathbf{w}(t)$ is the standard Wiener process (Brownian motion)

$$\mathbf{w}(t) - \mathbf{w}(s) \sim \mathcal{N}(0, t-s), \quad d\mathbf{w} = \epsilon \cdot \sqrt{dt}, \text{ where } \epsilon \sim \mathcal{N}(0, 1).$$

- ▶ $\mathbf{f}(\mathbf{x}, t)$ is the **drift** function of $\mathbf{x}(t)$.
- ▶ $g(t)$ is the **diffusion** coefficient of $\mathbf{x}(t)$.
- ▶ If $g(t) = 0$ we get standard ODE.

Stochastic differential equation (SDE)

$$d\mathbf{x} = \mathbf{f}(\mathbf{x}, t)dt + g(t)d\mathbf{w}$$

How to get distribution $p(\mathbf{x}|t)$ for $\mathbf{x}(t)$?

Theorem (Kolmogorov-Fokker-Planck)

Evolution of the distribution $p(\mathbf{x}|t)$ is given by the following ODE:

$$\frac{\partial p(\mathbf{x}|t)}{\partial t} = -\frac{\partial}{\partial \mathbf{x}}(\mathbf{f}(\mathbf{x}, t)p(\mathbf{x})) + \frac{1}{2}g^2(t)\frac{\partial^2 p(\mathbf{x}|t)}{\partial \mathbf{x}^2}$$

Stochastic differential equation (SDE)

Langevin SDE

Let consider special case of SDE with $g(t) = 1$ and $\mathbf{f}(\mathbf{x}, t) = \frac{1}{2} \frac{\partial}{\partial \mathbf{x}} \log p(\mathbf{x}|t)$.

$$d\mathbf{x} = \frac{1}{2} \frac{\partial}{\partial \mathbf{x}} \log p(\mathbf{x}|t) dt + d\mathbf{w}$$

Let apply KFP theorem.

$$\begin{aligned} \frac{\partial p(\mathbf{x}|t)}{\partial t} &= -\frac{\partial}{\partial \mathbf{x}} \left(p(\mathbf{x}|t) \frac{1}{2} \frac{\partial}{\partial \mathbf{x}} \log p(\mathbf{x}|t) \right) + \frac{1}{2} \frac{\partial^2 p(\mathbf{x}|t)}{\partial \mathbf{x}^2} = \\ &= -\frac{\partial}{\partial \mathbf{x}} \left(\frac{1}{2} \frac{\partial}{\partial \mathbf{x}} p(\mathbf{x}|t) \right) + \frac{1}{2} \frac{\partial^2 p(\mathbf{x}|t)}{\partial \mathbf{x}^2} = 0 \end{aligned}$$

The density is $p(\mathbf{x}|t) = \text{const.}$

Stochastic differential equation (SDE)

Langevin dynamic

Let discretize the Langevin SDE

$$\mathbf{x}_{t+1} = \mathbf{x}_t + \eta \frac{1}{2} \frac{\partial}{\partial \mathbf{x}} \log p(\mathbf{x}|t) + \sqrt{\eta} \cdot \epsilon, \quad \epsilon \sim \mathcal{N}(0, 1).$$

Statement

Let \mathbf{x}_0 be a random vector. Then under mild regularity conditions for small enough η samples from the following dynamics

$$\mathbf{x}_{t+1} = \mathbf{x}_t + \eta \frac{1}{2} \nabla_{\mathbf{x}_t} \log p(\mathbf{x}_t|\boldsymbol{\theta}) + \sqrt{\eta} \cdot \epsilon, \quad \epsilon \sim \mathcal{N}(0, 1).$$

will comes from $p(\mathbf{x}|\boldsymbol{\theta})$.

3. Langevin dynamic
4. Score matching

Score matching

We could sample from the model if we have $\nabla_{\mathbf{x}} \log p(\mathbf{x}|\boldsymbol{\theta})$.

Fisher divergence

$$D_F(\pi, p) = \frac{1}{2} \mathbb{E}_{\pi} \left\| \nabla_{\mathbf{x}} \log p(\mathbf{x}|\boldsymbol{\theta}) - \nabla_{\mathbf{x}} \log \pi(\mathbf{x}) \right\|_2^2 \rightarrow \min_{\boldsymbol{\theta}}$$

Score function

$$\mathbf{s}(\mathbf{x}, \boldsymbol{\theta}) = \nabla_{\mathbf{x}} \log p(\mathbf{x}|\boldsymbol{\theta})$$

Problem: we do not know $\nabla_{\mathbf{x}} \log \pi(\mathbf{x})$.

Theorem

$$\frac{1}{2} \mathbb{E}_{\pi} \left\| \mathbf{s}(\mathbf{x}, \boldsymbol{\theta}) - \nabla_{\mathbf{x}} \log \pi(\mathbf{x}) \right\|_2^2 = \mathbb{E}_{\pi} \left[\frac{1}{2} \left\| \mathbf{s}(\mathbf{x}, \boldsymbol{\theta}) \right\|_2^2 + \text{tr}(\nabla_{\mathbf{x}} \mathbf{s}(\mathbf{x}, \boldsymbol{\theta})) \right] + \text{const}$$

Here $\nabla_{\mathbf{x}} \mathbf{s}(\mathbf{x}, \boldsymbol{\theta}) = \nabla_{\mathbf{x}}^2 \log p(\mathbf{x}|\boldsymbol{\theta})$ is a Hessian matrix.

Score matching

Theorem

$$\frac{1}{2}\mathbb{E}_{\pi}\|\mathbf{s}(\mathbf{x},\boldsymbol{\theta})-\nabla_{\mathbf{x}}\log\pi(\mathbf{x})\|_2^2=\mathbb{E}_{\pi}\left[\frac{1}{2}\|\mathbf{s}(\mathbf{x},\boldsymbol{\theta})\|_2^2+\text{tr}(\nabla_{\mathbf{x}}\mathbf{s}(\mathbf{x},\boldsymbol{\theta}))\right]+\text{const}$$

Proof (only for 1D)

$$\mathbb{E}_{\pi}\|s(x)-\nabla_x\log\pi(x)\|_2^2=\mathbb{E}_{\pi}[s(x)^2+(\nabla_x\log\pi(x))^2-2[s(x)\nabla_x\log\pi(x)]]$$

$$\begin{aligned}\mathbb{E}_{\pi}[s(x)\nabla_x\log\pi(x)] &= \int \pi(x)\nabla_x\log p(x)\nabla_x\log\pi(x)dx \\ &= \int \nabla_x\log p(x)\nabla_x\pi(x)dx = \pi(x)\nabla_x\log p(x)\Big|_{-\infty}^{+\infty} \\ &= -\int \nabla_x^2\log p(x)\pi(x)dx = -\mathbb{E}_{\pi}\nabla_x^2\log p(x)\end{aligned}$$

$$\frac{1}{2}\mathbb{E}_{\pi}\|s(x)-\nabla_x\log\pi(x)\|_2^2=\frac{1}{2}\mathbb{E}_{\pi}[s(x)^2+\nabla_x s(x)]+\text{const.}$$

Summary

- ▶ Adjoint method generalizes backpropagation procedure and allows to train Neural ODE solving ODE for adjoint function back in time.
- ▶ Kolmogorov-Fokker-Planck theorem allows to construct continuous-in-time normalizing flow with less functional restrictions.
- ▶ FFJORD model makes such kind of flows scalable.
