Spring, 2022

## Recap of previous lecture

## Gaussian autoregressive flow (MAF)

$$\mathbf{x} = g(\mathbf{z}, \boldsymbol{\theta}) \quad \Rightarrow \quad x_i = \sigma_i(\mathbf{x}_{1:i-1}) \cdot z_i + \mu_i(\mathbf{x}_{1:i-1}).$$

$$\mathbf{z} = f(\mathbf{x}, \boldsymbol{\theta}) \quad \Rightarrow \quad z_i = (x_i - \mu_i(\mathbf{x}_{1:i-1})) \cdot \frac{1}{\sigma_i(\mathbf{x}_{1:i-1})}.$$

Generation function  $g(\mathbf{z}, \boldsymbol{\theta})$  is **sequential**. Inference function  $f(\mathbf{x}, \boldsymbol{\theta})$  is **not sequential**.

Inverse autoregressive flow (IAF)

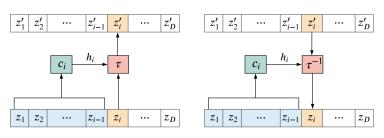

$$\mathbf{z} = g(\mathbf{z}, \boldsymbol{\theta}) \quad \Rightarrow \quad x_i = \tilde{\sigma}_i(\mathbf{z}_{1:i-1}) \cdot z_i + \tilde{\mu}_i(\mathbf{z}_{1:i-1})$$
 $\mathbf{z} = f(\mathbf{x}, \boldsymbol{\theta}) \quad \Rightarrow \quad z_i = (x_i - \tilde{\mu}_i(\mathbf{z}_{1:i-1})) \cdot \frac{1}{\tilde{\sigma}_i(\mathbf{z}_{1:i-1})}.$

# Dequantization

- Images are discrete data, pixels lie in the  $\{0, 255\}$  integer domain (the model is  $P(\mathbf{x}|\theta) = \text{Categorical}(\pi(\theta))$ ).
- Flow is a continuous model (it works with continuous data x).

By fitting a continuous density model to discrete data, one can produce a degenerate solution with all probability mass on discrete values.

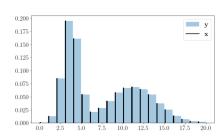

How to convert a discrete data distribution to a continuous one?

## Uniform dequantization

 $\mathbf{x} \sim \mathsf{Categorical}(\pi)$ 

 $\mathbf{u} \sim U[0,1]$ 

 $\mathbf{v} = \mathbf{x} + \mathbf{u} \sim \mathsf{Continuous}$ 

Theis L., Oord A., Bethge M. A note on the evaluation of generative models. 2015

# Uniform dequantization

#### Statement

Fitting continuous model  $p(\mathbf{y}|\boldsymbol{\theta})$  on uniformly dequantized data  $\mathbf{y} = \mathbf{x} + \mathbf{u}$ ,  $\mathbf{u} \sim U[0,1]$  is equivalent to maximization of a lower bound on log-likelihood for a discrete model:

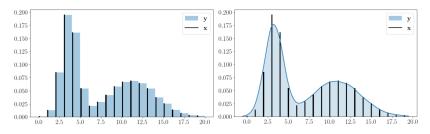

$$P(\mathbf{x}|\boldsymbol{\theta}) = \int_{U[0,1]} p(\mathbf{x} + \mathbf{u}|\boldsymbol{\theta}) d\mathbf{u}$$

#### Proof

$$\begin{split} \mathbb{E}_{\pi} \log p(\mathbf{y}|\boldsymbol{\theta}) &= \int \pi(\mathbf{y}) \log p(\mathbf{y}|\boldsymbol{\theta}) d\mathbf{y} = \\ &= \sum \pi(\mathbf{x}) \int_{U[0,1]} \log p(\mathbf{x} + \mathbf{u}|\boldsymbol{\theta}) d\mathbf{u} \leq \\ &\leq \sum \pi(\mathbf{x}) \log \int_{U[0,1]} p(\mathbf{x} + \mathbf{u}|\boldsymbol{\theta}) d\mathbf{u} = \\ &= \sum \pi(\mathbf{x}) \log P(\mathbf{x}|\boldsymbol{\theta}) = \mathbb{E}_{\pi} \log P(\mathbf{x}|\boldsymbol{\theta}). \end{split}$$

Theis L., Oord A., Bethge M. A note on the evaluation of generative models. 2015

# Variational dequantization

- ▶  $p(\mathbf{y}|\boldsymbol{\theta})$  assign unifrom density to unit hypercubes  $\mathbf{x} + U[0,1]$  (left fig).
- Neural network density models are smooth function approximators (right fig).
- Smooth dequantization is more natural.

How to perform the smooth dequantization?

#### Flow++

## Variational dequantization

Introduce variational dequantization noise distribution  $q(\mathbf{u}|\mathbf{x})$  and treat it as an approximate posterior.

Variational lower bound

$$\begin{split} \log P(\mathbf{x}|\boldsymbol{\theta}) &= \left[\log \int q(\mathbf{u}|\mathbf{x}) \frac{p(\mathbf{x} + \mathbf{u}|\boldsymbol{\theta})}{q(\mathbf{u}|\mathbf{x})} d\mathbf{u}\right] \geq \\ &\geq \int q(\mathbf{u}|\mathbf{x}) \log \frac{p(\mathbf{x} + \mathbf{u}|\boldsymbol{\theta})}{q(\mathbf{u}|\mathbf{x})} d\mathbf{u} = \mathcal{L}(q, \boldsymbol{\theta}). \end{split}$$

Uniform dequantization bound

$$\log P(\mathbf{x}|\boldsymbol{\theta}) = \log \int_{U[0,1]} p(\mathbf{x} + \mathbf{u}|\boldsymbol{\theta}) d\mathbf{u} \ge \int_{U[0,1]} \log p(\mathbf{x} + \mathbf{u}|\boldsymbol{\theta}) d\mathbf{u}.$$

Uniform dequantization is a special case of variational dequantization  $(q(\mathbf{u}|\mathbf{x}) = U[0,1])$ .

Ho J. et al. Flow++: Improving Flow-Based Generative Models with Variational Dequantization and Architecture Design, 2019

#### Flow++

#### Variational lower bound

$$\mathcal{L}(q, \theta) = \int q(\mathbf{u}|\mathbf{x}) \log \frac{p(\mathbf{x} + \mathbf{u}|\theta)}{q(\mathbf{u}|\mathbf{x})} d\mathbf{u}.$$

Let  $\mathbf{u} = h(\epsilon, \phi)$  is a flow model with base distribution  $\epsilon \sim p(\epsilon) = \mathcal{N}(0, \mathbf{I})$ :

$$q(\mathbf{u}|\mathbf{x}) = p(h^{-1}(\mathbf{u}, \phi)) \cdot \left| \det \frac{\partial h^{-1}(\mathbf{u}, \phi)}{\partial \mathbf{u}} \right|.$$

Flow-based variational dequantization

$$\log P(\mathbf{x}|oldsymbol{ heta}) \geq \mathcal{L}(\phi,oldsymbol{ heta}) = \int p(oldsymbol{\epsilon}) \log \left(rac{p(\mathbf{x} + h(oldsymbol{\epsilon},\phi)|oldsymbol{ heta})}{p(oldsymbol{\epsilon}) \cdot \left|\det rac{\partial h(oldsymbol{\epsilon},\phi)}{\partial oldsymbol{\epsilon}}
ight|^{-1}}
ight) doldsymbol{\epsilon}.$$

If  $p(\mathbf{x} + \mathbf{u}|\theta)$  is also a flow model, it is straightforward to calculate stochastic gradient of this ELBO.

Ho J. et al. Flow++: Improving Flow-Based Generative Models with Variational Dequantization and Architecture Design, 2019

#### Flow++

## Flow-based variational dequantization

$$\log P(\mathbf{x}|oldsymbol{ heta}) \geq \int p(oldsymbol{\epsilon}) \log \left( rac{p(\mathbf{x} + h(oldsymbol{\epsilon}, oldsymbol{\phi}))}{p(oldsymbol{\epsilon}) \cdot \left| \det rac{\partial h(oldsymbol{\epsilon}, oldsymbol{\phi})}{\partial oldsymbol{\epsilon}} 
ight|^{-1}} 
ight) doldsymbol{\epsilon}.$$

## Outline

- 1. Data dequantization
- 2. ELBO surgery
- 3. VAE prior

4. VAE posterior

## Likelihood-based models

#### Exact likelihood evaluation

- ► Autoregressive models (WaveNet, PixelCNN, PixelCNN++);
- ► Flow models (ReaINVP, IAF, Glow).

#### Approximate likelihood evaluation

Latent variable models (VAE).

What are the pros and cons of each of them?

#### **VAE** limitations

Poor generative distribution (decoder)

$$p(\mathbf{x}|\mathbf{z}, \boldsymbol{\theta}) = \mathcal{N}(\mathbf{x}|\boldsymbol{\mu}_{\boldsymbol{\theta}}(\mathbf{z}), \sigma^2_{\boldsymbol{\theta}}(\mathbf{z})) \quad \text{or } = \mathsf{Softmax}(\boldsymbol{\pi}_{\boldsymbol{\theta}}(\mathbf{z})).$$

Loose lower bound

$$\log p(\mathbf{x}|\boldsymbol{\theta}) - \mathcal{L}(q,\boldsymbol{\theta}) = (?).$$

Poor prior distribution

$$p(\mathbf{z}) = \mathcal{N}(0, \mathbf{I}).$$

Poor variational posterior distribution (encoder)

$$q(\mathsf{z}|\mathsf{x},\phi) = \mathcal{N}(\mathsf{z}|\pmb{\mu}_{\phi}(\mathsf{x}),\pmb{\sigma}_{\phi}^2(\mathsf{x})).$$

# **ELBO** surgery

$$\frac{1}{n}\sum_{i=1}^{n}\mathcal{L}_{i}(q,\theta) = \frac{1}{n}\sum_{i=1}^{n}\left[\mathbb{E}_{q(\mathbf{z}|\mathbf{x}_{i})}\log p(\mathbf{x}_{i}|\mathbf{z},\theta) - KL(q(\mathbf{z}|\mathbf{x}_{i})||p(\mathbf{z}))\right].$$

#### **Theorem**

$$\frac{1}{n}\sum_{i=1}^{n} KL(q(\mathbf{z}|\mathbf{x}_i)||p(\mathbf{z})) = KL(q_{\text{agg}}(\mathbf{z})||p(\mathbf{z})) + \mathbb{I}_q[\mathbf{x},\mathbf{z}],$$

- ▶  $\mathbb{I}_q[\mathbf{x}, \mathbf{z}]$  mutual information between  $\mathbf{x}$  and  $\mathbf{z}$  under empirical data distribution and distribution  $q(\mathbf{z}|\mathbf{x})$ .
- First term pushes  $q_{agg}(z)$  towards the prior p(z).
- Second term reduces the amount of information about x stored in z.

# **ELBO** surgery

#### **Theorem**

$$\frac{1}{n}\sum_{i=1}^{n} KL(q(\mathbf{z}|\mathbf{x}_i)||p(\mathbf{z})) = KL(q_{\text{agg}}(\mathbf{z})||p(\mathbf{z})) + \mathbb{I}_q[\mathbf{x},\mathbf{z}].$$

#### Proof

$$\begin{split} &\frac{1}{n}\sum_{i=1}^{n} \mathit{KL}(q(\mathbf{z}|\mathbf{x}_{i})||p(\mathbf{z})) = \frac{1}{n}\sum_{i=1}^{n} \int q(\mathbf{z}|\mathbf{x}_{i})\log\frac{q(\mathbf{z}|\mathbf{x}_{i})}{p(\mathbf{z})}d\mathbf{z} = \\ &= \frac{1}{n}\sum_{i=1}^{n} \int q(\mathbf{z}|\mathbf{x}_{i})\log\frac{q_{\mathrm{agg}}(\mathbf{z})q(\mathbf{z}|\mathbf{x}_{i})}{p(\mathbf{z})q_{\mathrm{agg}}(\mathbf{z})}d\mathbf{z} = \int \frac{1}{n}\sum_{i=1}^{n} q(\mathbf{z}|\mathbf{x}_{i})\log\frac{q_{\mathrm{agg}}(\mathbf{z})}{p(\mathbf{z})}d\mathbf{z} + \\ &+ \frac{1}{n}\sum_{i=1}^{n} \int q(\mathbf{z}|\mathbf{x}_{i})\log\frac{q(\mathbf{z}|\mathbf{x}_{i})}{q_{\mathrm{agg}}(\mathbf{z})}d\mathbf{z} = \mathit{KL}(q_{\mathrm{agg}}(\mathbf{z})||p(\mathbf{z})) + \frac{1}{n}\sum_{i=1}^{n} \mathit{KL}(q(\mathbf{z}|\mathbf{x}_{i})||q_{\mathrm{agg}}(\mathbf{z})) \end{split}$$

Without proof:

$$\mathbb{I}_q[\mathbf{x},\mathbf{z}] = \frac{1}{n} \sum_{i=1}^n KL(q(\mathbf{z}|\mathbf{x}_i)||q_{\text{agg}}(\mathbf{z})) \in [0,\log n].$$

Hoffman M. D., Johnson M. J. ELBO surgery: yet another way to carve up the variational evidence lower bound. 2016

# **ELBO** surgery

## **ELBO** revisiting

$$\frac{1}{n} \sum_{i=1}^{n} \mathcal{L}_{i}(q, \theta) = \frac{1}{n} \sum_{i=1}^{n} \left[ \mathbb{E}_{q(\mathbf{z}|\mathbf{x}_{i})} \log p(\mathbf{x}_{i}|\mathbf{z}, \theta) - KL(q(\mathbf{z}|\mathbf{x}_{i})||p(\mathbf{z})) \right] =$$

$$= \underbrace{\frac{1}{n} \sum_{i=1}^{n} \mathbb{E}_{q(\mathbf{z}|\mathbf{x}_{i})} \log p(\mathbf{x}_{i}|\mathbf{z}, \theta) - \mathbb{I}_{q}[\mathbf{x}, \mathbf{z}] - KL(q_{\text{agg}}(\mathbf{z})||p(\mathbf{z}))}_{\text{Marginal KL}}$$

Prior distribution  $p(\mathbf{z})$  is only in the last term.

## Optimal VAE prior

$$KL(q_{\text{agg}}(\mathbf{z})||p(\mathbf{z})) = 0 \quad \Leftrightarrow \quad p(\mathbf{z}) = q_{\text{agg}}(\mathbf{z}) = \frac{1}{n} \sum_{i=1}^{n} q(\mathbf{z}|\mathbf{x}_i).$$

The optimal prior  $p(\mathbf{z})$  is the aggregated posterior  $q_{\text{agg}}(\mathbf{z})$ .

Hoffman M. D., Johnson M. J. ELBO surgery: yet another way to carve up the variational evidence lower bound. 2016

## Outline

1. Data dequantization

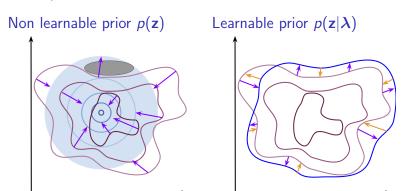

- 2. ELBO surgery
- 3. VAE prior

4. VAE posterior

# Optimal VAE prior

How to choose the optimal p(z)?

- ▶ Standard Gaussian  $p(\mathbf{z}) = \mathcal{N}(0, I) \Rightarrow$  over-regularization;
- ▶  $p(z) = q_{agg}(z) = \frac{1}{n} \sum_{i=1}^{n} q(z|x_i) \Rightarrow$  overfitting and highly expensive.

# Flows-based VAE prior

## Flow model in latent space

$$\log p(\mathbf{z}|\boldsymbol{\lambda}) = \log p(\mathbf{z}^*) + \log \det \left| \frac{d\mathbf{z}^*}{d\mathbf{z}} \right| = \log p(\epsilon) + \log \det \left| \frac{\partial g(\mathbf{z}, \boldsymbol{\lambda})}{\partial \mathbf{z}} \right|$$

- $\mathbf{z} = f(\mathbf{z}^*, \boldsymbol{\lambda}) = g^{-1}(\mathbf{z}^*, \boldsymbol{\lambda})$
- RealNVP flow.
- Autoregressive flow (MAF).

Why it is not a good idea to use IAF for VAE prior?

#### ELBO with flow-based VAE prior

$$\mathcal{L}(\phi, \boldsymbol{\theta}) = \mathbb{E}_{q(\mathbf{z}|\mathbf{x}, \phi)} \left[ \log p(\mathbf{x}|\mathbf{z}, \boldsymbol{\theta}) + \log p(\mathbf{z}|\boldsymbol{\lambda}) - \log q(\mathbf{z}|\mathbf{x}, \phi) \right]$$

$$= \mathbb{E}_{q(\mathbf{z}|\mathbf{x}, \phi)} \left[ \log p(\mathbf{x}|\mathbf{z}, \boldsymbol{\theta}) + \underbrace{\left( \log p(g(\mathbf{z}, \boldsymbol{\lambda})) + \log |\det \mathbf{J}_{g}| \right)}_{\text{flow-based prior}} - \log q(\mathbf{z}|\mathbf{x}, \phi) \right]$$

#### VAE limitations

Poor generative distribution (decoder)

$$p(\mathbf{x}|\mathbf{z}, \boldsymbol{\theta}) = \mathcal{N}(\mathbf{x}|\mu_{\boldsymbol{\theta}}(\mathbf{z}), \sigma_{\boldsymbol{\theta}}^2(\mathbf{z})) \quad \text{or } = \mathsf{Softmax}(\pi_{\boldsymbol{\theta}}(\mathbf{z})).$$

Loose lower bound

$$\log p(\mathbf{x}|\boldsymbol{\theta}) - \mathcal{L}(q,\boldsymbol{\theta}) = (?).$$

Poor prior distribution

$$p(\mathbf{z}) = \mathcal{N}(0, \mathbf{I}).$$

Poor variational posterior distribution (encoder)

$$q(\mathsf{z}|\mathsf{x},\phi) = \mathcal{N}(\mathsf{z}|\boldsymbol{\mu}_{\phi}(\mathsf{x}), \sigma_{\phi}^2(\mathsf{x})).$$

## Outline

1. Data dequantization

- ELBO surgery
- 3. VAE prior
- 4. VAE posterior

# Variational posterior

#### **ELBO**

$$\log p(\mathbf{x}|\boldsymbol{\theta}) = \mathcal{L}(q,\boldsymbol{\theta}) + KL(q(\mathbf{z}|\mathbf{x},\boldsymbol{\phi})||p(\mathbf{z}|\mathbf{x},\boldsymbol{\theta})).$$

- In E-step of EM-algorithm we wish  $KL(q(\mathbf{z}|\mathbf{x},\phi)||p(\mathbf{z}|\mathbf{x},\theta))=0.$  (In this case the lower bound is tight  $\log p(\mathbf{x}|\theta)=\mathcal{L}(q,\theta)$ ).
- Normal variational distribution  $q(\mathbf{z}|\mathbf{x},\phi) = \mathcal{N}(\mathbf{z}|\boldsymbol{\mu}_{\phi}(\mathbf{x}), \boldsymbol{\sigma}_{\phi}^2(\mathbf{x}))$  is poor (e.g. has only one mode).
- ► Flows models convert a simple base distribution to a complex one using invertible transformation with simple Jacobian. How to use flows in VAE posterior?

# Flows in VAE posterior

Apply a sequence of transformations to the random variable

$$\mathsf{z} \sim q(\mathsf{z}|\mathsf{x},\phi) = \mathcal{N}(\mathsf{z}|\pmb{\mu}_{oldsymbol{\phi}}(\mathsf{x}),\pmb{\sigma}_{oldsymbol{\phi}}^2(\mathsf{x})).$$

Let  $q(\mathbf{z}|\mathbf{x}, \phi)$  (VAE encoder) be a base distribution for a flow model.

## Flow model in latent space

$$egin{aligned} \log q(\mathbf{z}^*|\mathbf{x},\phi,oldsymbol{\lambda}) &= \log q(\mathbf{z}|\mathbf{x},\phi) + \log \det \left| rac{\partial g(\mathbf{z},oldsymbol{\lambda})}{\partial \mathbf{z}} 
ight| \ & \mathbf{z}^* = g(\mathbf{z},oldsymbol{\lambda}) = f^{-1}(\mathbf{z},oldsymbol{\lambda}) \end{aligned}$$

Here  $g(\mathbf{z}, \lambda)$  is a flow model (e.g. stack of planar/coupling/AR layers) parameterized by  $\lambda$ .

Let use  $q(\mathbf{z}^*|\mathbf{x}, \phi, \lambda)$  as a variational distribution. Here  $\phi$  – encoder parameters,  $\lambda$  – flow parameters.

# Flows-based VAE posterior

- ▶ Encoder outputs base distribution  $q(\mathbf{z}|\mathbf{x}, \phi)$ .
- Flow model  $\mathbf{z}^* = g(\mathbf{z}, \lambda)$  transforms the base distribution  $q(\mathbf{z}|\mathbf{x}, \phi)$  to the distribution  $q(\mathbf{z}^*|\mathbf{x}, \phi, \lambda)$ .
- ▶ Distribution  $q(\mathbf{z}^*|\mathbf{x}, \phi, \lambda)$  is used as a variational distribution for ELBO maximization.

## Flow model in latent space

$$\log q(\mathbf{z}^*|\mathbf{x},\phi,oldsymbol{\lambda}) = \log q(\mathbf{z}|\mathbf{x},\phi) + \log \det \left| rac{\partial g(\mathbf{z},oldsymbol{\lambda})}{\partial \mathbf{z}} 
ight|$$

## ELBO with flow-based VAE posterior

$$\begin{split} \mathcal{L}(\phi, \theta, \lambda) &= \mathbb{E}_{q(\mathbf{z}^* | \mathbf{x}, \phi, \lambda)} \big[ \log p(\mathbf{x}, \mathbf{z}^* | \theta) - \log q(\mathbf{z}^* | \mathbf{x}, \phi, \lambda) \big] \\ &= \mathbb{E}_{q(\mathbf{z}^* | \mathbf{x}, \phi, \lambda)} \log p(\mathbf{x} | \mathbf{z}^*, \theta) - \mathit{KL}(q(\mathbf{z}^* | \mathbf{x}, \phi, \lambda) || p(\mathbf{z}^*)). \end{split}$$

The second term in ELBO is reverse KL divergence. Planar flows was originally proposed for variational inference in VAE.

# Flows-based VAE posterior

## Flow model in latent space

$$\log q(\mathsf{z}^*|\mathsf{x},\phi,oldsymbol{\lambda}) = \log q(\mathsf{z}|\mathsf{x},\phi) + \log \det \left| rac{\partial g(\mathsf{z},oldsymbol{\lambda})}{\partial \mathsf{z}} 
ight|$$

## ELBO objective

$$\begin{split} \mathcal{L}(\phi, \theta, \lambda) &= \mathbb{E}_{q(\mathbf{z}^* | \mathbf{x}, \phi, \lambda)} \big[ \log p(\mathbf{x}, \mathbf{z}^* | \theta) - \log q(\mathbf{z}^* | \mathbf{x}, \phi, \lambda) \big] = \\ &= \mathbb{E}_{q(\mathbf{z} | \mathbf{x}, \phi)} \left[ \log p(\mathbf{x}, \mathbf{z}^* | \theta) - \log q(\mathbf{z}^* | \mathbf{x}, \phi, \lambda) \right] \Big|_{\mathbf{z}^* = g(\mathbf{z}, \lambda)} = \\ &= \mathbb{E}_{q(\mathbf{z} | \mathbf{x}, \phi)} \bigg[ \log p(\mathbf{x}, \mathbf{z}^* | \theta) - \log q(\mathbf{z} | \mathbf{x}, \phi) - \log \left| \det \left( \frac{\partial g(\mathbf{z}, \lambda)}{\partial \mathbf{z}} \right) \right| \bigg]. \end{split}$$

- Obtain samples **z** from the encoder  $q(\mathbf{z}|\mathbf{x}, \phi)$ .
- ▶ Apply flow model  $\mathbf{z}^* = g(\mathbf{z}, \lambda)$ .
- ► Compute likelihood for **z**\* using the decoder, base distribution for **z**\* and the Jacobian.

# Inverse autoregressive flow (IAF)

$$\mathbf{z} = g(\mathbf{z}, \boldsymbol{\theta}) \quad \Rightarrow \quad x_i = \tilde{\sigma}_i(\mathbf{z}_{1:i-1}) \cdot z_i + \tilde{\mu}_i(\mathbf{z}_{1:i-1}).$$

$$\mathbf{z} = f(\mathbf{x}, \boldsymbol{\theta}) \quad \Rightarrow \quad z_i = (x_i - \tilde{\mu}_i(\mathbf{z}_{1:i-1})) \cdot \frac{1}{\tilde{\sigma}_i(\mathbf{z}_{1:i-1})}.$$

#### Reverse KL for flow model

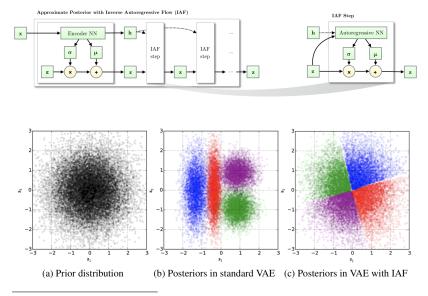

$$\mathit{KL}(p||\pi) = \mathbb{E}_{p(\mathbf{z})} \left[ \log p(\mathbf{z}) - \log \left| \det \left( \frac{\partial g(\mathbf{z}, \boldsymbol{\theta})}{\partial \mathbf{z}} \right) \right| - \log \pi(g(\mathbf{z}, \boldsymbol{\theta})) \right]$$

- ▶ We don't need to think about computing the function  $f(\mathbf{x}, \theta)$ .
- ► Inverse autoregressive flow is a natural choice for using flows in VAE:

$$\mathbf{z} = \sigma(\mathbf{x}) \odot \epsilon + \mu(\mathbf{x}), \quad \epsilon \sim \mathcal{N}(0, 1); \quad \sim q(\mathbf{z}|\mathbf{x}, \phi).$$

$$\mathbf{z}_k = \tilde{\sigma}_k(\mathbf{z}_{k-1}) \odot \mathbf{z}_{k-1} + \tilde{\mu}_k(\mathbf{z}_{k-1}), \quad k \geq 1; \quad \sim q_k(\mathbf{z}_k|\mathbf{x}, \phi, \{\lambda_i\}_{i=1}^k).$$

# Inverse autoregressive flow (IAF)

Kingma D. P. et al. Improving Variational Inference with Inverse Autoregressive Flow, 2016

# Flows-based VAE prior vs posterior

#### **Theorem**

VAE with the flow-based prior for latent code  $\mathbf{z}$  is equivalent to VAE with flow-based posterior for latent code  $\mathbf{z}$ .

#### Proof

$$egin{aligned} \mathcal{L}(\phi, heta, \pmb{\lambda}) &= \mathbb{E}_{q(\mathbf{z}|\mathbf{x}, \phi)} \log p(\mathbf{x}|\mathbf{z}, \theta) - \underbrace{\mathcal{K}L(q(\mathbf{z}|\mathbf{x}, \phi)||p(\mathbf{z}|\pmb{\lambda}))}_{ ext{flow-based prior}} \ &= \mathbb{E}_{q(\mathbf{z}|\mathbf{x}, \phi)} \log p(\mathbf{x}|\mathbf{z}, \theta) - \underbrace{\mathcal{K}L(q(\mathbf{z}|\mathbf{x}, \phi, \pmb{\lambda})||p(\mathbf{z}))}_{ ext{flow-based posterior}} \end{aligned}$$

(Here we use Flow KL duality theorem from Lecture 4)

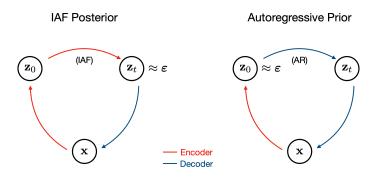

## Flows in VAE posterior

$$\mathcal{L}(\phi, \theta, \lambda) = \mathbb{E}_{q(\mathbf{z}|\mathbf{x}, \phi)} \bigg[ \log p(\mathbf{x}, \mathbf{z}^*|\theta) - \log q(\mathbf{z}|\mathbf{x}, \phi) - \log \bigg| \det \bigg( \frac{\partial g(\mathbf{z}, \lambda)}{\partial \mathbf{z}} \bigg) \bigg| \, \bigg].$$

# Flows-based VAE prior vs posterior

- ▶ IAF posterior decoder path:  $p(\mathbf{x}|\mathbf{z}, \theta)$ ,  $\mathbf{z} \sim p(\mathbf{z})$ .
- ▶ AF prior decoder path:  $p(\mathbf{x}|\mathbf{z}, \boldsymbol{\theta})$ ,  $\mathbf{z} = f(\mathbf{z}^*, \boldsymbol{\lambda})$ ,  $\epsilon \sim p(\mathbf{z}^*)$ .

The AF prior and the IAF posterior have the same computation cost, so using the AF prior makes the model more expressive at no training time cost.

#### **VAE** limitations

Poor generative distribution (decoder)

$$p(\mathbf{x}|\mathbf{z}, \boldsymbol{\theta}) = \mathcal{N}(\mathbf{x}|\boldsymbol{\mu}_{\boldsymbol{\theta}}(\mathbf{z}), \sigma^2_{\boldsymbol{\theta}}(\mathbf{z})) \quad \text{or } = \mathsf{Softmax}(\boldsymbol{\pi}_{\boldsymbol{\theta}}(\mathbf{z})).$$

Loose lower bound

$$\log p(\mathbf{x}|\boldsymbol{\theta}) - \mathcal{L}(q,\boldsymbol{\theta}) = (?).$$

Poor prior distribution

$$p(\mathbf{z}) = \mathcal{N}(0, \mathbf{I}).$$

Poor variational posterior distribution (encoder)

$$q(\mathsf{z}|\mathsf{x},\phi) = \mathcal{N}(\mathsf{z}|\boldsymbol{\mu}_{\phi}(\mathsf{x}), \sigma_{\phi}^2(\mathsf{x})).$$

# Summary

- Dequantization allows to fit discrete data using continuous model.
- Uniform dequantization is the simplest form of dequantization. Variational dequantization is a more natural type that was proposed in Flow++ model.
- ► The ELBO surgery reveals insights about a prior distribution in VAE. The optimal prior is the aggregated posterior.
- We could use flow-based prior in VAE (moreover, autoregressive).
- We could use flows to make variational posterior more expressive. This is equivalent to the flow-based prior.
